12. Delivery plan and scope lock
13. Glossary

How to read this document. The executive summary explains what RightAlly is in two pages. The glance, audience and journey sections show how it fits together. Each module recap then explains, in plain language, how that module works for the brokerage, its agents, their customers and the RightAlly team. The glossary explains real estate and platform terms.

Executive summary

RightAlly is an all-in-one, affordable SaaS platform for US real estate brokerages. One login replaces the many separate tools a brokerage pays for today (website, CRM, marketing, e-sign, transactions, commissions, compliance), and AI works inside every part of it.

Today a typical brokerage stitches together an IDX website vendor, a CRM, a forms and e-sign tool, a transaction and back-office system, marketing tools, a recruiting tool and spreadsheets for licences and revenue share. Each has its own fee, login and copy of the data. Agents re-type the same client into several systems, nothing connects a lead to the commission it produces, and the broker's software bill grows with every agent.

RightAlly connects the whole cycle in one place: a buyer finds the brokerage's website, becomes a lead, works with an agent, signs documents, closes a deal, and the agent, their upline and the brokerage are paid from one ledger. A brokerage signs up online, goes live the same day on a premium template, connects its MLS and invites its agents.

Item	Detail
Who it is for	US real estate brokerages of every size, their staff and agents, and the buyers, sellers, homeowners and recruits they serve
What it replaces	IDX website vendor, CRM, marketing automation, forms and e-sign, transaction management and back office, commission and revenue-share tracking, compliance checks, training and support tools
Scope	38 modules in four suites (Grow, Run, Protect, Know) on one Platform Core
Positioning	Easy to use and affordable: everything in one place, live the same day, priced below the stack it replaces
How it is sold	Packages and add-on modules with per-agent seats; usage credits for SMS, calls and AI at near cost; agents can buy add-ons themselves
Built on	Laravel 13, PHP 8.5, React and MySQL 8.4 on AWS, with a multi-provider AI gateway (Claude as primary, plus OpenAI, Google Gemini and open-source models); cell-based multi-tenant SaaS designed for 100,000 brokerages and millions of agents
Trust	Strict AI data protection (no brokerage or agent can see another's data through AI), role-based permissions, tamper-proof audit log, per-brokerage encryption, SOC 2 readiness, full data export at any time
Existing customers	Today's paying RightAlly brokerages move across with their plans, genealogy, earnings and ledger intact
Delivery	Version 1.0 in about 61 two-week sprints with five teams (65 including buffer); existing customers join as pilots around Sprint 26

Three things set RightAlly apart from the market leaders:

1. **Lead to payout in one ledger.** CRM, transactions, commissions, caps, revenue share and payouts share one data model, so nothing is re-typed and every dollar is traceable.
2. **AI in every module, with the broker in control.** Instant lead response, Deal-IQ (an AI transaction coordinator), compliance checks on every flyer, an AI setup assistant and a guarded chatbot; AI flags and drafts, people decide.
3. **Live the same day, and easy to switch to.** Self-service signup, an AI setup assistant, ready-made templates, and one-click plus white-glove migration from the tools brokerages use today.

RightAlly is also **built to spread**: agents can start on their own with a solo plan, love the results, and pull their broker in, while brokers see a free health check of their business, a branded preview of their own RightAlly site, and a switch with no risk.

The platform at a glance

The 38 modules sit in four suites on one Platform Core. A brokerage gets the modules in its package, buys more as add-ons, and decides which staff and agents get access to each.

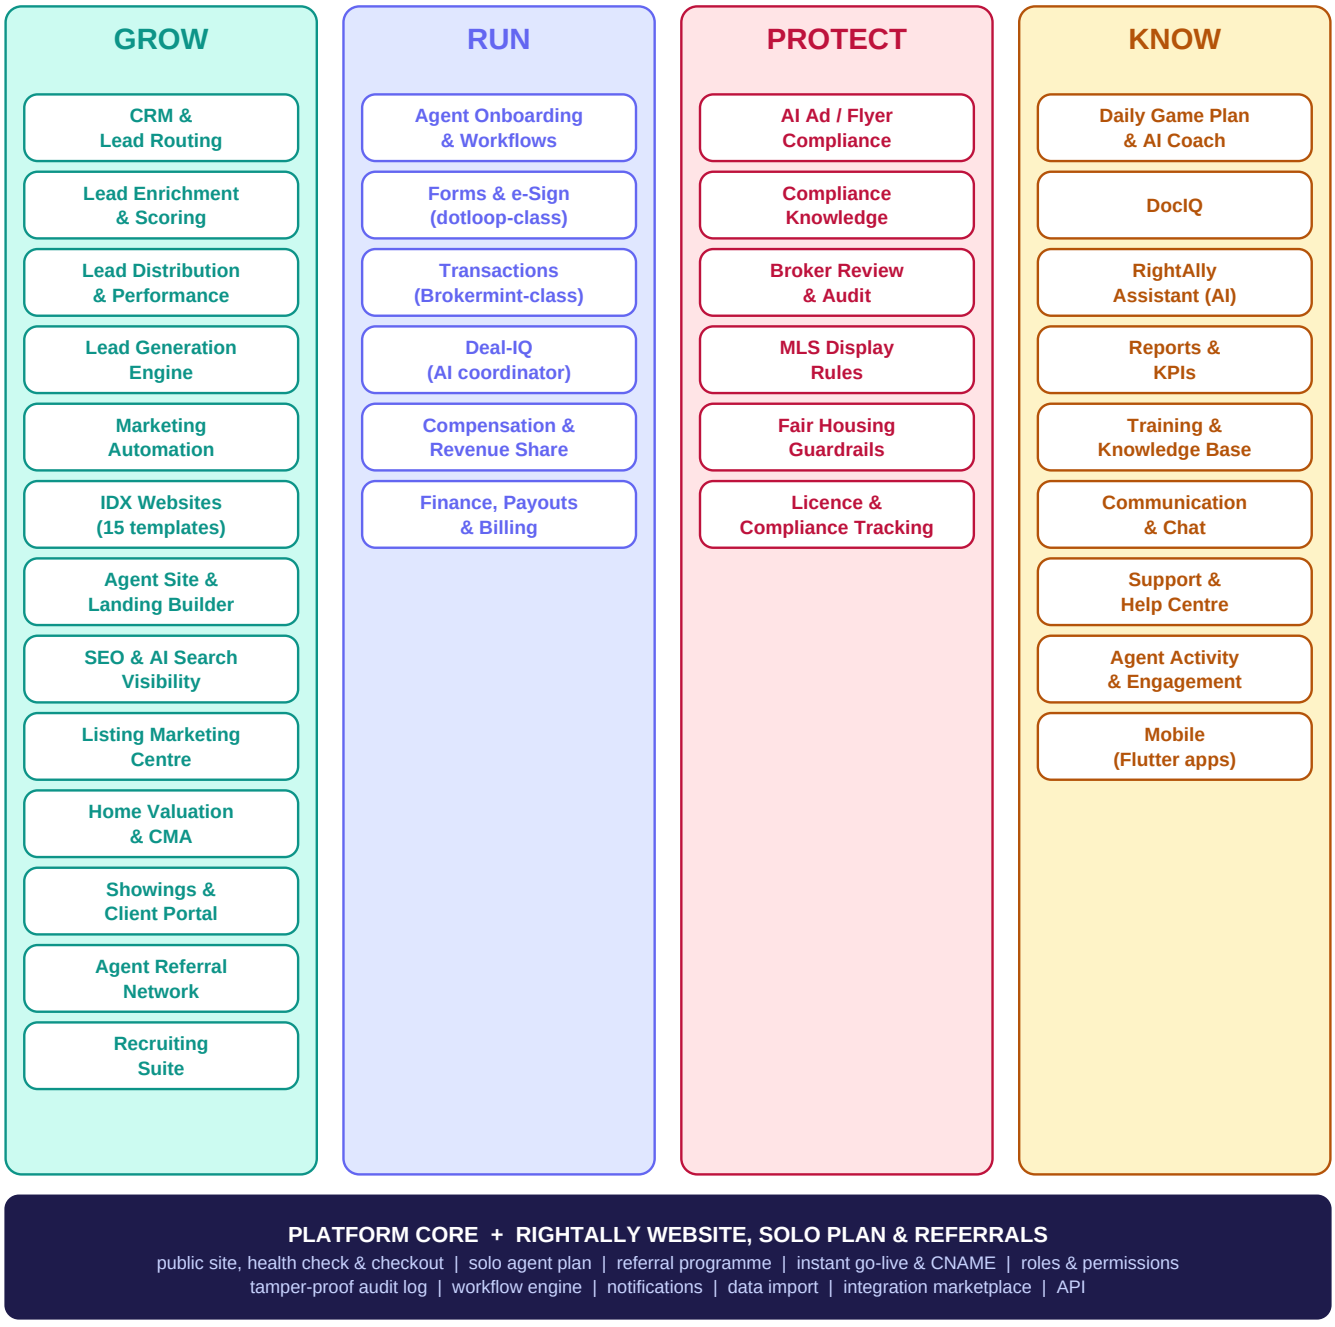

Figure 1 - The 38 modules: four suites on Platform Core and the RightAlly signup website

Who uses RightAlly

Four groups use the platform, each with its own view of the same data; every module in this document explains what it does for each of them.

Who	Who they are	What RightAlly gives them
RightAlly HQ	The RightAlly team: super admin and HQ staff (sales, package managers, billing, onboarding, support, content, release managers)	One console to sell packages, launch and support brokerages, maintain shared libraries (templates, forms, compliance rules) and release updates to every brokerage at once
Brokerage	The broker-owner, office managers and staff (transaction coordinators, accountants, marketing, compliance, recruiting)	One back office for website, agents, deals, money and compliance, with staff roles they control and a full audit trail
Agents	Licensed agents, team leads and recruiters in the brokerage	One app for leads, marketing, documents, deals, earnings, revenue share and downline, on web and phone
Customers	Buyers, sellers, homeowners and agent recruits who interact with the brokerage	Fast, premium websites, instant answers, easy e-signing, showing requests and a client portal to follow their deal

Inside a brokerage, people are organised as brokerage, offices, teams and agents. Brokers and agents log in from the brokerage's own website address and land on the screens their role allows.

The RightAlly journey

A brokerage goes from its first visit on rightally.io to paying its agents without leaving the platform; every step is a module described in the recap that follows.

Steps 1-4 happen once; steps 5-8 repeat for every agent and every deal

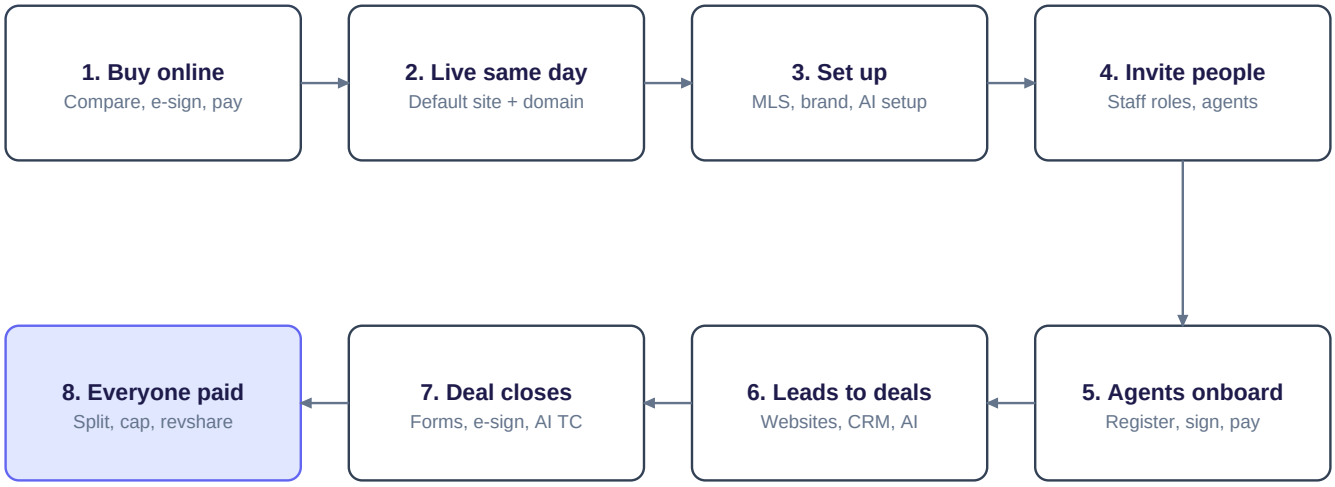

Figure 2 - The RightAlly journey from signup to payout

Steps 1 to 4 happen once, when a brokerage joins. Steps 5 to 8 repeat every day for every agent and every deal, and each one feeds the next: the lead becomes the deal, the deal produces the commission, and the commission pays the agent and their upline.

1. **Buy online.** The broker compares packages on rightally.io, uses the savings calculator, books a demo if they wish, then e-signs the agreement and pays.
2. **Live the same day.** The brokerage's website goes live on a default template at brokerage.rightally.app; adding a CNAME switches it to the brokerage's own domain with automatic SSL.
3. **Set up.** The broker connects the MLS, sets brand and colours, and lets the AI setup assistant draft the comp plan, checklists and workflows from their own documents.
4. **Invite people.** Staff get roles and permissions; agents get invitations or arrive through recruiting pages and referral links.
5. **Agents onboard.** Each agent registers, uploads documents, e-signs the agreement, pays and is approved, all in one guided flow.
6. **Leads become deals.** Websites, ads and listing marketing bring leads; AI answers in seconds; agents work them in the CRM.
7. **The deal closes.** Buyer agreements, forms and e-signatures, checklists, broker review and Deal-IQ carry the deal to closing.
8. **Everyone is paid.** The compensation engine calculates split, cap, deductions and revenue share; Finance records it in the ledger and pays the agent and their upline.

Module recap: platform and HQ

These parts run underneath everything else: how brokerages buy and set up RightAlly, who can do what, how every change is recorded, and how the RightAlly team runs the service.

RightAlly Website & Signup

The public rightally.io website runs on a full CMS and is where brokerages learn about RightAlly, compare packages and buy; signing up creates their platform automatically.

Who	How it works for them
Customers (prospective brokerages)	Read product pages, guides, case studies and comparisons; enter what they pay today for their current tools in a savings calculator and see what they would save; book a demo in the RightAlly calendar; choose a package, apply a coupon, e-sign the RightAlly agreement and pay the deposit online
Brokerage	Receives an admin login and setup wizard the moment payment clears, with its website already live on brokerage.rightally.app
RightAlly HQ	Content staff publish pages, blog posts and campaign pages with the same premium builder, with drafts, scheduling and approval; the site uses the same SEO and AEO engine as tenant sites; every enquiry lands in RightAlly's own CRM; staff adjust go-live dates and billing and see signed contracts

Brokerage Health Check. A free tool on rightally.io: the broker enters current tools and costs and gets a report showing software spend and savings, agent production against the market from MLS data, recruiting opportunities, and a scan of their current website for SEO, AEO, speed, accessibility and fair housing issues.

Instant branded preview. Before buying, a broker enters their domain and MLS and sees their own brokerage in RightAlly within minutes: a premium template with their logo, colours and listings, and their agent roster.

Switching without risk. White-glove migration included, a parallel run where commissions must match before switching, the data-export guarantee, and a satisfaction promise set by RightAlly HQ.

Platform Core

The shared foundation every brokerage gets on day one: setup, branding, domains, logins, seats, billing and data tools.

Who	How it works for them
Brokerage	Follows a setup wizard; uploads its policy manual, commission schedule and agent agreement to the AI setup assistant, which drafts the comp plan, checklists and workflows for approval; starts from a ready-made library of comp plans, workflows, campaigns and checklists; sets logo, colours and fonts (the full palette is generated with an accessibility check); points its own domain by CNAME with automatic SSL; creates offices and teams; assigns modules and seats; tops up usage credits for SMS, calls and AI at near cost, with spending limits; decides which add-ons agents may buy themselves; imports data or uses one-click migration; exports all its data at any time; runs in English and Spanish
Agents	Log in from the brokerage's website address; choose simple mode (today's work only) or the full view; find anything from one search bar; receive a daily game plan each morning (see Daily Game Plan & AI Coach); turn on 2FA or a passkey if they want; buy add-ons themselves where allowed; use everything on the installable mobile web app
Customers	Use the brokerage's websites, emails and client portal in English or Spanish
RightAlly HQ	Places each new brokerage in a cell automatically and maintains the shared libraries every brokerage starts from

Open integration marketplace. Brokerages keep the tools they love through Zapier, webhooks and the public API, with ready connectors listed in a marketplace, so no one has to give something up to switch.

RightAlly Credits. AI and usage-based services run on one currency, priced per action rather than per token so everyone understands it (for example a listing description, an enrichment lookup, an SMS, a call minute or a video tour each cost a set number of credits). Everyday AI (instant lead replies, the daily game plan, fair-housing checks, website chat) is included in seats with fair-use limits; heavy or variable usage uses credits. Brokerages and agents buy credit packs by card with optional auto-recharge, low-balance alerts and volume discounts; monthly included credits reset and purchased credits roll over for 12 months. When a brokerage creates the plans its agents join, it gives each plan a monthly credit allowance from its pool, sets per-agent caps and decides whether agents may top up themselves; assistants draw from their agent's allowance. Every credit movement is visible by feature and user and recorded in the ledger and audit log.

Staff, roles & permissions

One permission engine runs both RightAlly HQ and every brokerage, controlling access module by module and action by action.

Who	How it works for them
Brokerage	Invites staff separately from agents; starts from ready roles (office manager, transaction coordinator, accountant, marketing, content, compliance, recruiter, support) or builds custom ones; sets view, create, edit, delete, approve and export rights per module, scoped to own records, team, office or the whole brokerage; sees newly released modules marked New with no access until granted; masks SSNs and bank details unless permitted; sets approval limits such as two approvers above a payout amount; grants temporary access; exports an access review
Staff	Log in at the brokerage's domain and see only what their role allows
Agents	Can hold an extra role, such as team lead, mentor or recruiter
RightAlly HQ	Uses the same engine for its own staff: package managers, sales, billing, onboarding, support, content and release managers

Audit log

Every change in RightAlly is recorded with who, what, when, from where, and the values before and after.

> Nobody can edit or delete the audit log, neither brokerages nor RightAlly. It is append-only, hash-chained and kept for 7 years by default.

Who	How it works for them
Brokerage	Searches by user, module, record, action or date; opens the full history of any record; exports for audits; gets alerts on risky events such as permission escalation, bulk deletes or bank-detail changes; sees every time RightAlly support entered its account
Agents	See their own activity history
RightAlly HQ	Searches across brokerages, verifies the log's integrity and streams events to security monitoring; HQ staff actions are logged too

AI Data Protection

AI in RightAlly only ever sees what the person asking is allowed to see: no brokerage can see another brokerage's data, and no agent can see or request another agent's data through AI.

Who	How it works for them
Brokerage	Its data is isolated with its own tenant ID, encryption keys and AI search space, so no other brokerage's AI can reach it; staff and AI see only what each role allows; turns AI on or off per module, sets retention, and can export or delete data at any time; sees in the audit log which records each AI answer used
Agents	AI acts with exactly their permissions: their own contacts, deals and documents only; another agent asking about them gets nothing, because those records are filtered out before the AI sees anything; their personal-sphere contacts are private by default, while business data (deals, documents, compliance and company-provided leads) is visible to the brokerage; each brokerage can change this in settings, and agents are told what applies to them
Assistants and solo agents	Assistants see only their own agent's data; solo agents have a fully private workspace
RightAlly HQ	Never trains or fine-tunes AI on customer data; uses AI providers with zero data retention; strips personal details before AI calls where possible; runs automated leak tests on every release that try to reveal another agent's or brokerage's data, and blocks the release if any succeed

How it is enforced. Every AI request is built fresh with only the permitted data, so nothing carries over between users. Only non-private content is shared: public MLS listings, the state law and MLS rule library and RightAlly help content. Documents, emails and forms are treated as data, never as instructions, so hidden text cannot make the AI break its rules; the AI can only take actions the user is allowed to take, and sending or deleting always needs confirmation. Features that span brokerages use only safe data: the referral network shows opt-in, referral-only figures; recruiting uses MLS production data the licence allows; and the daily game plan learns from anonymised, aggregated patterns, never from one brokerage's contacts or deals.

HQ console (super admin)

The console the RightAlly team uses to run the SaaS: what is sold, to whom, and how releases reach brokerages.

Who	How it works for them
RightAlly HQ	Creates and versions packages for brokerages and solo agents, add-ons, seat prices and usage-credit rates, with approval before changes go live; manages every brokerage's package, usage, health and billing; enters a brokerage for support only with consent and full audit; maintains the IDX templates, state form library, compliance rules and template library; manages MLS connections; turns new features on for pilot brokerages first, then for all, with release notes; tracks MRR, churn, active agents and module adoption; monitors SEO and AEO scores across all sites; runs the white-glove migration service
Brokerage	Sees new features arrive with release notes and never runs updates itself; has its move from old tools done for it

Credit rate card and margins. When HQ builds a package it sees the credits included, what those credits cost RightAlly at real provider prices and the resulting margin, with a warning below a set threshold; a live dashboard compares provider spend with credits used per brokerage and per feature.

AI model registry. All AI runs through one provider-neutral gateway. Claude (Haiku for high-volume tasks, Sonnet as the workhorse, Opus for the hardest reasoning) is the primary family, with OpenAI GPT, Google Gemini and self-hosted open-source models as alternatives and fallbacks, plus specialist services for embeddings, speech-to-text and voice-over. HQ adds models with their real costs, chooses the model and fallback chain for each feature, tests a

new model against quality checks before switching, and sees cost and quality per model. Only providers with no-training and zero-data-retention terms are used, personal data is removed before calls, and compliance features stay locked to one validated model. Costs are kept down with prompt caching, half-price batch processing for overnight work and per-brokerage spending caps.

Existing RightAlly customers move to the new platform through a dedicated legacy migration: plans, agents, sponsor trees, agreements, deals, earnings and ledger balances are carried over, and old and new commission figures run in parallel until they match to the cent. These brokerages are the first pilots, from around Sprint 26.

RightAlly for Agents (solo plan)

Any agent can use RightAlly on their own, before their brokerage joins, with their own website, landing pages and optional assistants, and bring their broker in when they are ready.

Who	How it works for them
Agents	Choose a solo package created by RightAlly HQ (for example Solo Free with limits, Solo Pro, or Solo Pro with assistants); log in through the RightAlly website to their own private workspace; get the personal CRM with instant AI lead response and unified inbox, lead enrichment and smart scoring, the daily game plan, marketing automation, CMA, net sheets and buyer cost estimates, and the referral network; build a personal website (home, about, testimonials, blog, guides, valuation, contact) from dedicated solo templates plus landing pages, on a RightAlly sub-domain or their own domain by CNAME with automatic SSL; showcase their own listings entered manually with photos and AI video tours; keep their own contacts if they move brokerages; share "my numbers since RightAlly" win cards
Assistants	Work inside the agent's workspace on the agent's behalf, with a role preset (Full, Lead / ISA, Marketing or Admin): follow up leads, answer the shared inbox, book appointments, take actions the agent assigns from the daily game plan, run campaigns and pages, prepare CMAs and net sheets, and manage the calendar; by default they cannot change billing, export the database, see the agent's earnings or delete in bulk; every action is logged as done for the agent
Brokerage	Receives an "Ask my broker" request whenever a solo agent tries a feature that needs the brokerage, with the agent's own results, the brokerage's likely savings and a one-click demo or trial; when the brokerage joins, the agent's workspace, contacts and assistants fold in with nothing lost, and assistants become staff scoped to that agent
RightAlly HQ	Creates solo packages, limits, trials and add-ons (assistant seats, enrichment credits, dialer) in the same package engine used for brokerages; tracks which agents bring in which brokerages

What needs the brokerage. A solo workspace is fully isolated: no staff, no team, no genealogy and no view of other agents, apart from opted-in agents in the referral network directory. Features that legally or practically need a brokerage unlock through "Ask my broker": the IDX website and MLS search (MLS rules require the broker's authorisation), transactions, forms and e-sign, compensation, revenue share, payouts, compliance review and recruiting. Every solo page still shows the agent's brokerage name and licence number, as advertising rules require, and the AI compliance check runs on solo content too.

Referral & Affiliate Programme

Everyone who brings RightAlly a new brokerage is rewarded, so growth comes from the people who love the product.

Who	How it works for them
Agents	Earn credits or a share of the subscription when a brokerage they introduce joins; invite outside agents to receive referrals through the referral network, which requires joining RightAlly

Who	How it works for them
Brokerage	Earns rewards for referring other brokerages; uses the "we give every agent RightAlly" recruiting badge and toolkit
RightAlly HQ	Sets reward rules, tracks attribution and pays rewards through the same ledger

Module recap: Grow suite

Grow brings in business: websites that rank and convert, leads answered in seconds, marketing that runs itself, and listings that market themselves. Thirteen modules.

CRM & Lead Routing

The CRM that finds deals in your own database. A brokerage with 30,000 contacts has roughly 1,500 moves a year inside its own data. RightAlly's CRM is built to find them, help agents act on them and prove the results.

Area	What agents and brokers get
Core (built)	Contacts and households with one privacy rule (an agent's personal sphere stays private), timeline, tasks and reminders, buyer and seller pipelines with drag and drop, tags, smart lists, CSV import with notes and history, duplicate merge, and consent records (automated or AI texts only with written consent)
AI brief (built)	On every contact: who they are, what they want, where things stand, the next step and why, and a ready draft in a channel consent allows; Fair Housing wording removed; refreshed automatically and overnight
Work my list (built)	One contact at a time through any list: call, text or email, one-tap outcome, next
Ask your database (built)	Type or speak: "buyers relocating to Fondren I haven't called in 2 weeks"; each result shows why it matched; save as a list
Voice (built)	Speak a quick update, a search or a new contact; always shown as editable text with Confirm; audio never stored
Rhythm and follow-up plans (built)	A/B/C/D keep-in-touch ranking, birthdays and home anniversaries, and follow-up plans that arrive as tasks on the right day and stop when the person responds
Database intelligence (planned)	Nightly AI research with opportunity scores and reasons, intents from old notes, Today's 10, opportunity alerts, database health and a pipeline commission forecast
Differentiators (planned)	Email-first AI assistant for the dormant database, consent builder, personal memory, referral engine, monthly personal content, lead ponds, signal-triggered cards and postcards, database value dashboard and proof report

Sign-in security (built). Two-step verification required for owners, finance access and HQ staff; passkeys offered after sign-in; trusted devices for 30 days; new-device alerts; a sessions screen; owner-assisted recovery.

Where each brokerage's data lives. Secure shared databases ("cells") with every record tied to its brokerage; any brokerage can move to its own dedicated database from the HQ console (second approver, 14-day switch-back); MLS listings stored once per MLS and shown only to brokerages with an approved licence.

Every contact, conversation and lead in one place, answered instantly and routed to the right agent.

Who	How it works for them
Brokerage	Connects lead sources (website, Zillow, Realtor.com, Facebook, Google, Zapier); sets routing rules by area, price, language or performance with response-time limits and automatic re-routing; tunes the AI's tone, hours and hand-off rules; sees lead source, cost per lead, conversion and response times by agent
Agents	Have every new lead texted and emailed by AI within seconds, qualified and handed over with a summary; work one unified inbox for SMS, email, website chat and social messages; see each contact's full timeline; call through lists with the power dialer, with recorded calls turned into AI summaries and next steps; send video messages; share booking links; follow a daily to-do list
Customers	Get an answer within seconds at any hour and can book time with the agent directly

Lead intelligence. When a website lead lands in the CRM, the agent sees everything the buyer did before calling: every home viewed and how often, time spent, favourites, homes compared side by side, searches by area, price and features and how they have shifted, plus an AI summary note at the top of the contact with what the buyer wants, top homes, likely timeline and suggested talking points. Agents get a hot-lead alert the moment a lead returns or re-views a home, and a best-time-to-call hint based on when the lead is active.

Lead Enrichment & Smart Scoring

Agents import their whole database, enrich every contact with one click, and see who is most likely to buy or sell now, so they work the right people first.

Who	How it works for them
Agents	Import contacts from CSV, phone, Gmail or Outlook, or an old CRM; enrich one contact or the whole list (validated phone and email, Do Not Call check, home ownership, estimated value and equity, years owned, renter or owner, and likely-to-move signals from licensed property-data providers); see every contact sorted into Hot, Warm, Nurture, Cold or Do not contact, with the reason shown ("viewed 6 homes in Ridgeland in 2 days, owns home with high equity"); start database reactivation, where AI sends personal check-ins to old contacts and anyone who replies with interest jumps to Hot
Brokerage	Sets scoring rules and enrichment spending limits (each lookup uses usage credits); sees hot leads not yet touched across agents; ensures consent and Do Not Call rules apply before any outreach
Customers	Hear from the agent when they are actually ready, with relevant homes, instead of generic follow-up

Scores combine intent (what the contact is doing now), fit (area, price, property type), readiness (timeline and pre-approval from AI conversations), engagement and likelihood to move, refresh daily and feed the daily game plan. Enriched data is used for marketing and prioritising only, never for credit or eligibility decisions.

Lead Distribution & Agent Performance

Brokerage leads go to the agents who respond fast, follow up and close, the way portals such as Realtor.com reward performance; agents who do not follow the rules receive fewer leads until they improve.

Who	How it works for them
Brokerage	Imports leads (CSV, lead sources, purchased leads) into distribution pools; sets targets for first response time, contact within a set time, follow-up touches in the first 7 days, CRM updates within 48 hours, appointment rate, closing rate and client reviews; gives each agent a performance score (0 to 100) over a rolling 30 or 90 days and places agents in tiers it names (for example Top, Standard, Probation); sends hot leads to the top tier first through offer windows (first to accept wins, then the next tier); sets capacity caps per agent; reclaims leads automatically when contact targets are missed; pauses company-paid leads for agents on probation; gives new agents a starter allocation; overrides any assignment, with every assignment in the audit log

Who	How it works for them
Agents	See their score, tier, what affects it and how to raise it, with coaching tips; accept offered leads from phone or email; earn more and better leads by responding fast and closing
Customers	Are contacted quickly by an agent who has proven they follow up

Company-provided leads can carry their own split in the compensation engine (lead-source-based splits), so brokerages can price the leads they supply.

Lead-IQ (Lead Generation Engine)

Lead-IQ — leads the brokerage owns, worked by AI. Agents stop paying portals 30–50% of their commission: Lead-IQ generates leads the brokerage owns, works every one by AI text and voice, and hands the agent a qualified lead with a summary.

Part	What it does
Buyer leads	AI buyer ads from real listings (optimised on closings); the IDX website, neighbourhood pages and AI chat; every listing as a buyer magnet (property site, text-for-info sign code, open-house sign-in); rent-vs-buy and affordability tools; content and social autopilot; move-up buyers from the brokerage's own database; incoming referrals; RESPA-compliant lender and builder co-marketing
Seller leads	Home valuation capture, database reactivation, and the AI Prospector: "find likely sellers near 14 Oak St" from licensed property data, scrubbed against Do Not Call
Ask by prompt	"Find buyers for 14 Oak St" or "Who's looking for a 3-bed under $350k in Fondren?": top matches with the reason for each and the next step; "find me more buyers" builds an ad campaign and open-house plan
AI follow-up	An AI text or call within one minute, day or night; personalised from history; qualifies budget, area, timeline, pre-approval and motivation; 12-month nurture; books appointments; transfers hot callers live to the agent
Lead brief	Push notification and one screen: who they are, what they want, why now, homes viewed, conversation summary with recording, suggested next step and a drafted first message; one tap to accept
Proof	ROI by source to closed commission, and the saving compared with portal fees

AI calls and texts only with recorded consent, an AI disclosure on every conversation, recording consent where required, quiet hours, Do Not Call and "STOP" honoured everywhere.

Ready-to-run lead machines that bring in high-quality buyer leads for brokerages, agents in brokerages and solo agents, judged by closings rather than clicks.

Who	How it works for them
Brokerage	Launches company buyer funnels in a few clicks, each with a landing page, ad campaign, lead form, AI follow-up and nurture campaign (first-time buyer guide, homes under a set price in a city, new construction, relocation, VA and FHA-friendly homes, price-drop alerts, open-house finder, rent-versus-buy calculator); has the AI write ad copy, build creatives from listings and brand assets and suggest budget and area, with Meta's housing-ad rules applied, publishing to its own Meta and Google accounts; feeds every lead into Lead Distribution so the best-performing agents get them; sees cost per lead, per appointment and per closing by source, with AI budget suggestions

Who	How it works for them
Agents (in a brokerage or solo)	Launch the same funnels for their own area under brokerage rules (solo agents use their personal site and landing pages instead of IDX search); get leads already validated, qualified by the AI and scored for quality; run a content engine of AI-drafted neighbourhood pages, market reports and blog posts reviewed before publishing; keep Google Business Profile posts and reviews active; let social autopilot post listings, market updates and short videos to Instagram, Facebook, TikTok and YouTube Shorts, linking back to their pages
Customers	Find useful guides, alerts and homes that match what they want, and get a fast, relevant response

Quality, not volume. RightAlly sends Meta and Google the leads that became appointments and closings, so their algorithms find more people like real buyers; phone and email validation block fake leads, and every lead arrives with a quality score. Ad spend is paid by the brokerage or agent directly to Meta and Google, and no platform can guarantee lead volume; the engine makes every dollar produce better leads and shows which spend leads to closings.

Marketing Automation & Ad Campaigns

Campaigns that nurture leads automatically, plus ads built and published from the brokerage's own ad accounts.

Who	How it works for them
Brokerage	Builds and shares brokerage campaigns and brand templates; completes SMS registration; manages consent and unsubscribes; connects its own Meta and Google Ads accounts to create campaigns, ad sets and ads and publish them from RightAlly, billed directly by Meta and Google, with housing-ad rules applied automatically; collects reviews and shows testimonials on the website
Agents	Start ready campaigns triggered by behaviour (viewed listing, price drop, anniversary); send listing alerts and monthly market reports; schedule social posts; launch an ad for a listing in a few clicks; request reviews automatically after closing
Customers	Receive relevant listings and market updates instead of generic blasts, and can unsubscribe anytime

IDX Websites

Premium brokerage websites with live MLS search, built from 15 conversion-tested templates.

Who	How it works for them
Brokerage	Selects its MLS, enters its MLS IDs and e-signs the MLS authorisation (RightAlly holds the feed keys); picks one of 15 templates and edits logo, colours, hero carousel or video, featured listings, communities, testimonials, menus, blog and pop-up forms; adds pages from templates or blank; previews, schedules and rolls back changes; gets legal and accessibility-compliant pages automatically
Agents	Get a matching profile page showing their own listings; share searches and listings; receive leads from their links
Customers	Search by map, list, drawn area or in plain English ("3 beds near good schools under $400k"); view MLS, AI video and 360° tours and floor plans; compare homes side by side; use mortgage calculators; chat with a 24/7 AI assistant that answers questions and books showings
RightAlly HQ	Ingests each MLS once and applies each MLS's display rules automatically across all brokerages

Agent Site & Landing Builder

Agents build their own pages from templates or from scratch, within the brokerage's brand and compliance rules.

Who	How it works for them
Brokerage	Locks brand and compliance blocks; shares page templates; connects Join buttons to onboarding; decides whether agents get sub-domains or their own domains; sees page performance and referral results across agents
Agents	Pick a ready template (listing, open house, buyer guide, valuation, about me) or drag sections onto a blank page; publish on a sub-domain or their own domain; share a personal referral link or QR code where leads go to their CRM and recruits are assigned to them as sponsor; A/B test pages
Customers	Land on fast, polished pages that answer their question and make the next step easy

SEO & AI Search Visibility

Every site and page is built to be found on Google and cited by AI assistants, and is crawled and audited automatically.

Who	How it works for them
Brokerage	Gets server-rendered pages, clean URLs, schema markup, sitemaps, llms.txt and Search Console submission without setup; sees each page's SEO and AEO score with a fix list after automatic crawls; gets community pages generated from MLS data; sees search and AI-assistant traffic
Agents	Get the same standards on every landing page, with a score and fix-it tips per page
Customers	Find the brokerage when they search Google or ask an AI assistant
RightAlly HQ	Maintains the platform-wide SEO and AEO checklist and watches scores across all tenant sites

Every page is guaranteed to pass 100% of RightAlly's technical SEO and AEO checks. Rankings also depend on content, links and competition, so no platform can guarantee them.

List-IQ (Listing Marketing Centre)

List-IQ — the listing studio. The agent takes photos on their phone at the property; List-IQ turns them into professional photos, motion videos and a high-converting listing draft, ready to publish, saving hours and the cost of a photographer for most listings.

Step	What List-IQ does
Guided shoot	Room-by-room shot list with on-screen framing guides
Professional photos	Light and colour balanced, windows recovered, lines straightened, skies improved; optional virtual staging and decluttering, labelled "virtually staged" as MLSs require
Motion videos	A property video with movement and licensed music, plus vertical reels for Instagram, Facebook and TikTok; optional AI voice-over in English or Spanish
Listing draft	Headline, description and key features within MLS character limits, checked for fair-housing language; MLS fields pre-filled

Step	What List-IQ does
Publish in one go	Property website, social posts, flyer and email blast; a ready-to-paste MLS input sheet, or direct submission where an MLS allows it
Floor plans	From a phone scan on LiDAR-equipped phones

Edits never hide permanent defects, every output passes AI Ad & Flyer Compliance, and the agent approves before anything is published.

Every new listing gets its marketing kit automatically, in the brokerage's brand and checked for compliance.

Who	How it works for them
Brokerage	Sets brand templates, video styles and phrases to avoid once; sees open-house and marketing activity across agents
Agents	On each new listing receive a single-property website, flyers, social posts and an email blast; generate an AI listing description checked for fair housing language; turn photos into an AI video tour; add 3D tours or build a 360° walk-through; scan a home with their phone for a floor plan; run open-house sign-in by QR or tablet; put text and QR codes on yard signs; share a performance report with the seller
Customers	See richer listings, register at open houses in seconds and get instant details from a yard sign

Home Valuation & CMA

Seller lead pages, instant estimates and branded market analyses that win listings.

Who	How it works for them
Brokerage	Publishes valuation pages, chooses the valuation data provider, and brands CMA, net sheet and buyer-cost templates
Agents	Turn valuation requests into seller leads; build a comparative market analysis from MLS data in minutes; create seller net sheets and buyer cost estimates; send owners automatic monthly value updates
Customers	Get an instant value range for their home and clear numbers on what they will net or pay

Showings & Client Portal

Showing requests, tour planning and one branded place for clients to follow their deal.

Who	How it works for them
Brokerage	Sets showing rules per office, connects ShowingTime where the local MLS relies on it, brands the client portal and sees showing activity
Agents	Accept, reschedule or decline showing requests from their phone; manage requests on their own listings with seller approval and automatic feedback requests; plan multi-home tours with routes
Customers	Request showings from the website; follow saved homes, showings, documents to sign, milestones and key dates in the client portal

Agent Referral Network

AI Networking Assistant. In the back office, brokerage owners and staff, agents and solo agents type or speak an address and the help they need (a listing partner, **an agent with buyers for their seller's home**, a buyer's agent where their client is moving, or local help). It shows the top-producing agents near the property **from the MLS feed, from any brokerage**, ranked for the side needed by recent nearby sales, price range and home type; the user's own brokerage agents are tagged and can be shown first. Agents can post buyer or listing requests to the network, tap to call, or send an AI-drafted email they approve; conversations and referrals are tracked in the CRM through to closing and the referral fee is paid through the compensation engine. Coverage follows MLS data licences (per MLS region, growing market by market), with state licensing data as a fallback.

A referral network across RightAlly brokerages, with fees tracked all the way to payout.

Who	How it works for them
Brokerage	Opts in, chooses which agents appear, approves referrals and tracks referral fees flowing into Transactions and Finance
Agents	Find agents in other markets by area, language and specialty; send or receive a client with a broker-to-broker agreement e-signed in the platform; see status and expected fee; rate partners
Customers	Moving to another city, they are handed to a trusted agent there

Referral Trust Score. Before sending a referral, agents and broker owners see each partner's score card: activity status (Active, Idle or Away), acceptance rate and speed of contacting referred clients, referred clients converted and closed, recent MLS production, ratings from referring agents, active licence, specialties and areas. Clear warnings appear ("Last active 9 days ago, may not respond", "Slow to contact referred clients", "New to the network, no history yet"). The best matches are listed first; a referral can go to the top three with the first to accept winning; and if the partner does not contact the client within the referral time limit, it returns so the sender can choose someone else. Across brokerages only referral-related figures are shown, for agents who opt in.

Recruiting Suite

Best-in-class recruiting for brokers and agents: find the right agents, reach them, show them what they would earn, and convert them into onboarding.

Who	How it works for them
Brokerage	Searches an agent database built from MLS production (volume, units, average price, current brokerage and history, where the MLS licence allows); gets alerts when an agent's production jumps, they change brokerages or reach a licence anniversary; runs automated recruiting email and text campaigns with consent rules; tracks recruits in a pipeline; publishes a career site, recruiting events and interview booking; shows recruits a comparison of what they would earn at the brokerage versus their current one; sees recruiting ROI by source and the production each recruit brings after joining; sends a signed-up recruit straight into onboarding
Agents	Recruit through their referral link and QR code, run their own recruiting campaigns if allowed, see their recruits in a personal pipeline, and earn sponsor credit and revenue share tracked automatically; appear on recruiter leaderboards
Customers (recruits)	Compare their current earnings with the brokerage's plans, book an interview or career night, and join in a few guided steps

Recruiting badge. Brokerages on RightAlly can promote "we give every agent RightAlly" with a ready-made recruiting toolkit (badge, career-page section, social posts, comparison sheet), turning the platform itself into a reason for agents to join them.

Attraction Engine. The Recruiting Suite also attracts agents, not just tracks them: a likely-to-move score for every agent in the market (time at current brokerage, production trend, recent team or brokerage changes, licence anniversary); AI-personalised outreach written from each agent's own production and followed up over months; recruiting ad funnels with career pages, culture videos and "what would I earn?" calculators, with Meta's employment-ad rules applied; agent testimonials and success stories collected and published automatically; an income illustration showing how revenue share and caps would work for a recruit under the brokerage's real plans; and every agent recruiting through their referral link, revenue-share incentive and recruiting leaderboard.

Module recap: Run suite (back office)

Run is how the brokerage operates: agents join, documents get signed, deals close, and every dollar is recorded in one ledger. It replaces today's RightAlly platform plus separate forms and transaction tools. Six modules.

Agent Onboarding & Workflows

The current RightAlly joining flow, rebuilt as an editable workflow; the same engine powers every other step-by-step process.

Who	How it works for them
Brokerage	Uses the standard flow (register, documents and addendum, agreement e-sign, payment, approval, welcome) or edits its steps; versions agreements and sees who signed which version; sets onboarding and monthly fees per plan; approves or rejects with comments; tracks MLS and board onboarding; builds other workflows for transfers, offboarding and policy acknowledgement
Agents (new joiners)	Join from an invite, the website or a recruiting agent's page; upload their licence and complete an electronic W-9 with tax ID check from their phone; e-sign and pay online; stop and resume where they left off; see what is still missing

Forms & e-Sign

Deal rooms, state forms and legally valid e-signatures, at the level of dotloop.

Who	How it works for them
Brokerage	Publishes state and brokerage forms (state forms under licence) and a clause library; sets the buyer agreement template and required compensation fields; sets required signers and signing order; shares room templates by deal type; reviews documents before they go out
Agents	Send a buyer agreement for e-sign before touring, straight from the contact; open a room per deal and invite clients, co-agents, lenders and title; fill forms auto-populated from the deal and MLS data; sign in person or remotely on any device; have key dates and prices pulled from signed documents into the deal
Customers	Review and sign on their phone in minutes, with a legally valid audit certificate

Native forms come first. RightAlly's own forms and e-sign are the default: a form builder where any uploaded PDF is turned into a smart form by AI (fields detected and mapped to deal, contact and MLS data), conditional fields, calculations, signature and initial blocks, version control and templates by deal type and state; the brokerage's own forms, addenda, disclosures and buyer agreements; e-signatures with a legally valid audit trail, signing order, in-person and remote signing, bulk send, automatic reminders and optional identity verification; and official state association forms added as licences are signed.

Works with the tools agents love. Agents who prefer dotloop, SkySlope, Lone Wolf (zipForm and Transact) or DocuSign link their account once: RightAlly pre-fills their forms with deal and client data and pulls back signed documents, signature status and key dates into the RightAlly transaction, checklist, compliance review, Deal-IQ and commission flow. Brokerages can adopt RightAlly without forcing anyone to switch forms tools.

Transactions

Every deal from contract to close, with checklists and review, at the level of Brokermint.

Who	How it works for them
Brokerage	Sees every listing, buyer, dual, lease and referral deal in one pipeline; defines required documents by deal type and state; works one review queue; has AI check every upload for missing signatures, initials and dates before staff look; tracks earnest money and escrow; generates commission disbursement authorizations; imports past deals
Agents	Create deals or convert a CRM contact into one; upload documents against the checklist and fix AI-flagged issues before submitting; see the expected commission before closing

Deal-IQ (AI transaction coordinator)

Deal-IQ — your AI transaction coordinator. Agents talk or type to it, it reads the contract, keeps every deadline, drafts the paperwork, chases every party and answers clients around the clock under the agent's brand. Nothing is sent or signed without the agent's approval.

Capability	What it does
Talk or type to it	Type in the chat on any deal, or tap the mic and speak on any device, from a phone to the laptop or desktop dashboard on the website: speech is converted to text the agent can check or edit before Deal-IQ acts. Agents can also text or send a voice note to their Deal-IQ number (voice notes are transcribed) or email it, and turn on read-aloud answers for hands-free use. For example: "What's left on 14 Oak Street?", "Move the inspection to Friday and tell the lender", "Draft a 3-day extension". Deal-IQ previews what it will do and waits for confirmation
Start a deal any way	Upload, forward the contract email, text a photo, or say "new deal"; Deal-IQ creates the deal, parties, timeline and checklist and flags anything uncertain
Contract and addendum drafting	Offers, counters, extensions, amendments and termination notices on the correct licensed state form, filled from the CRM and MLS, sent for e-signature after approval
Client concierge, 24/7	In the client portal with the agent's name, photo and brokerage; answers only from that client's own deal; never gives legal, tax or financial advice; hands those to the agent, who sees every conversation
All-party portal	Title, lender, the cooperating agent and attorneys see their milestones and document requests and upload directly through a secure link
Deal health in the daily game plan	At-risk deadlines, missing signatures and overdue documents become the morning's top actions; brokers see at-risk deals across the brokerage

Also in Deal-IQ (from a review of the leading AI coordinators: ListedKit, DocJacket and Trackxi)

Capability	What it does
Inbox intelligence	Agents connect Gmail or Outlook; every deal email is filed to the right deal even without the address in the subject, summarised and turned into tasks; replies go from the agent's own address after approval, with no AI branding
Smart timeline engine	State rule packs kept by RightAlly HQ (business days, holidays, attorney-review states, earnest-money deadlines); counteroffer chains resolved to the binding terms; amendments recalculate every dependent deadline and list who to notify; checklists adapt to property type and financing; the brokerage's own checklist in plain English becomes rules

Capability	What it does
Continuous compliance scan	At intake and on every new document, graded blocker / warning / info: missing signatures, blank fields, mismatches across documents, missing referenced documents, required disclosures, buyer agreement before touring; a broker-ready score and one-click submission at 100%
Deadlines that cannot be missed	Escalation from in-app to email, text and automated voice call; calendar invites to all parties; at-risk prediction ("lender silent for 5 days"); blockers within 48 hours escalate to the broker
Money milestones and wire-fraud protection	Earnest money tracked to receipt, commission disbursement authorisation from the compensation engine, closing-disclosure timing, verified wiring instructions and call-back reminders; wire details never sent by email
Daily brief and ask-across-deals	Morning brief of due, overdue and upcoming items; "Which deals close this week?" across every deal the user may see; automatic weekly client updates
TC team mode	Assign deals to human coordinators, workload dashboard with one-click nudges; brokerages can sell TC service to agents for a per-file fee through the compensation engine
After closing	Compliance archive kept for each state's retention period, review requests and past-client follow-up
Results dashboard	Days to close, deadline-miss rate, files broker-ready at first submission, hours saved
Seller and buyer appointment flow	Record the listing or buyer consultation with everyone's consent; the AI drafts the agreement on the licensed state form, runs every check and sends it for signature in one click with a personalised seller or buyer guide
Multiple-offer management	Every offer side by side with net to the seller, financing, contingencies, closing date and risk flags; a plain-English summary for the seller; highest-and-best messages to every buyer's agent; counter-offer drafted for the chosen one
Inspection response and repair requests	From the inspection report, a repair request or credit addendum drafted item by item, edited with the client, sent for signature, with the response deadline tracked
Listing-to-contract coordination	Listing agreement and disclosures, MLS input checklist, photography, sign and lockbox scheduling, go-live dates, showing feedback and price-change reminders: one coordinator from listing taken to closed
Special deal types	Ready-made timelines and checklists for new construction, leases, short sales and bank-owned properties, probate and estates, and 1031 exchanges (45-day and 180-day deadlines)
MLS status compliance reminders	Reminders before each MLS's deadline for pending, closed, withdrawn and price-change updates, so agents avoid fines; brokers see overdue updates
Vendor scheduling and closing-day logistics	Book inspectors, appraisers, photographers, stagers and movers from the brokerage's preferred vendors (no paid placement without legal review); closing appointment, final walkthrough checklist and a client moving list
Concierge in the client's language	The client concierge answers in English or Spanish

Deal-IQ catches issues before the broker does; the broker remains legally responsible for file review.

RightAlly AI Transaction Suite. DocIQ and Deal-IQ are sold together as the RightAlly AI Transaction Suite (DocIQ alone is the entry option). Agents see one assistant on every deal: "Ask anything or tell me what to do", by typing or tapping the mic.

Easy to use, by rule. Every RightAlly module must work on first use with no required setup, keep one screen and one box per record, speak plain English or Spanish, preview every AI action with a single Confirm, keep the ten most common actions within three taps on a phone, open on "What needs you today", and teach in the moment instead of through training courses. Every sprint that ships screens is tested with five real agents or brokers before release, and

we measure time to first useful result (target under 5 minutes) and weekly use after a month.

Branded, never plain. Every AI message, video and document is professional and branded to the brokerage, and passes the brand and compliance check before it goes out.

Part	What it does
Brand guide, uploaded once	The AI extracts colours, fonts, logo versions and rules, taglines, disclaimers and tone from the brokerage's brand guide; the broker approves
Brand Voice	Tone rules for all AI writing (formal or warm, words to use and avoid, emojis, sign-off) in English and Spanish
Professional templates	Designer-made, branded emails (logo, agent photo, signature, licence number, Equal Housing logo), seller and buyer guides, lead briefs, flyers, social posts, property websites and reports
Branded videos	Intros and outros, logo watermark, captions in brand fonts and colours, approved music and brand-tone voice-over
Texts	Brand Voice, the brokerage named as advertising rules require, links to branded pages
Team and agent branding	Agent photo, team name and colours within the brokerage's limits and state rules
Quality gate	Brand, spelling, grammar and compliance checked on every output; preview before sending
Brand consistency report	Outputs by agent with any brand issues caught
Who	What they get
Brokerage owner and staff	Oversight of every deal within their scope, broker-file completeness and approvals; control over what the concierge may answer, which actions need broker approval and which state forms are licensed
Agents in a brokerage	Full use on their own deals, flowing into the brokerage's transaction file, compliance review and commission calculation
Solo agents	The personal side (contract reading, timeline, reminders, voice and text, concierge, DocIQ, drafting on forms they are licensed to use) plus a one-click broker packet to their broker by email or dotloop/SkySlope; full broker-file submission unlocks through Ask my broker

Deal-IQ goes beyond stand-alone AI transaction coordinators such as ProxiClose and Transaction Wingman: it combines their contract writing, branded client assistant and all-party hub with voice commands, any-channel intake, and the forms, e-sign, compliance, commissions and CRM already in RightAlly. Sold as an add-on; voice, drafting and concierge conversations use credits.

An AI that does a transaction coordinator's routine work, with people in control.

Who	How it works for them
Brokerage	Sets standard timelines by deal type and state; chooses whether AI messages need approval or send automatically; sees deals at risk across the office
Agents	Upload the signed contract; the AI builds the timeline with every key date, reminds buyers, sellers, lenders, title and inspectors in the agent's name, and chases missing documents; agents see one closing countdown and can edit or pause any message
Customers	Always know what is next and what they still need to provide

Compensation & Revenue Share

Beyond BoldTrail and Lone Wolf. Pre-split and post-split deductions; franchise and royalty fees with their own caps; credits and bonuses; excluding a deal from the plan and cap with a reason; deal classes; partial payments and holdbacks; **automatic recalculation** of every pending deal when anything changes; caps tracked **across all offices and teams**; **AI plan setup** from plain English or an uploaded agent agreement; an agent earnings view ("$600 from cap"); and plan profitability before changing a plan.

The commission engine at the heart of today's RightAlly, rebuilt so any brokerage can configure it without code.

Who	How it works for them
Brokerage	Builds plans with registration and monthly fees, percentage splits, flat fees, caps with reset dates, post-cap fees, team splits, rank and target based splits, lead-source-based splits for company-provided leads, and multi-level revenue share on Net Profit or GCI, with eligibility rules and root fallback; keeps a versioned deductions catalogue; changes plans with effective dates; models changes in a simulator first; sees the full organisation tree and every agent's cap status; reassigns sponsors with an audit trail and sets rules for a leaving agent's downline
Agents	See their plan in plain language, cap progress, rank and target progress; explore their downline as a genealogy tree, level-wise list or team summary with new joins and active status; see which downline deal produced each revenue share payment; run "what if" on a deal
Customers (recruits)	Compare plans with the simulator before joining

Finance, Payouts & Billing

One double-entry ledger for every commission, fee and payout, with agent billing, automatic payouts, tax forms and brokerage accounting reports.

Who	How it works for them
Brokerage	Sees every money movement as a ledger entry, corrected only by reversal; collects electronic W-9s with tax ID checks; records commission cheques and wires from title companies and matches them to deals; sets automatic payout rules (deal closed, compliance approved and funds received, then the agent and upline are paid automatically), with holds for missing documents or unpaid fees; deducts offsets such as unpaid fees, E&O premiums or referral fees at payout; pays referral fees, co-op splits and vendors from the same ledger; reconciles operating and trust bank accounts; invoices and auto-charges agent fees with retries; runs payouts by ACH or bank file, or same-day after approval; files 1099-NECs with the IRS and delivers them electronically; syncs to QuickBooks Online or Xero; sees GCI, company dollar, P&L by office and team, agent profitability, cap and fee projections, trust account reports by state and a revenue forecast from the pipeline
Agents	See a full earnings statement, projected income and a monthly statement emailed automatically; complete their W-9 online; save cards and pay invoices; connect a bank account through Stripe Connect; get paid automatically when a deal closes and funds arrive, or the same day once approved; receive 1099s electronically

Module recap: Protect suite (compliance)

Protect keeps the brokerage out of trouble: marketing is checked before it goes out, agents get sourced answers on the rules, licences never lapse unnoticed, and the broker has one review queue with a full audit trail. Six modules.

> AI flags issues and cites the rule; the broker always makes the final decision.

AI Ad & Flyer Compliance

Agents check any piece of marketing in seconds and fix it before it goes out.

Who	How it works for them
Agents	Upload a flyer, social post, ad, email, landing page, yard sign or business card in the compliance tracker, drop it into the AI chat, or snap a photo of a printed piece; content published from RightAlly is checked automatically. They get a status (Compliant, Warnings, Not compliant), boxes drawn on the image at each problem, the rule behind each issue in plain English, and one-click fixes (insert brokerage logo and licence number, add the Equal Housing logo, rewrite flagged wording), then re-check
Brokerage	Adds its own rules (team-name prominence, required disclaimers, approved logos) to the state, MLS and fair housing rules; optionally approves before anything is published; sees every check per agent and the most common issues, to target training
RightAlly HQ	Maintains the state and MLS advertising rule library used by every brokerage

Because RightAlly holds the brokerage's data, it also checks what a general AI tool cannot: price, beds, baths, square footage and status against the live MLS listing; that the agent's licence is active; and photos carrying another brokerage's watermark. Every version is kept, so before and after are always visible.

Compliance Knowledge

A NotebookLM-style assistant for state law, licence rules, MLS rules and brokerage policy.

Who	How it works for them
Agents	Ask questions in plain English and get answers that cite the exact source, or "not found" instead of a guess; search the brokerage's own documents
Brokerage	Adds its policy manual and other documents; gets alerts when a rule in the library changes
RightAlly HQ	Curates and updates the law and MLS rule library for each state

Better than a shared notebook. Some brokerages today share a general AI notebook such as Google's NotebookLM, where agents ask a question and copy and paste the answer. Compliance Knowledge gives sourced answers inside the places agents work (flyer check, listing description, transaction, AI chat and email), uses a library RightAlly curates and updates for each state and MLS alongside the brokerage's own documents, logs every question and answer for the broker, and lets agents escalate to the broker in one click.

Licence & Compliance Tracking

Licences, continuing education, insurance and dues tracked for every agent, with automatic reminders.

Who	How it works for them
Brokerage	Keeps every agent's licence number, state and expiry, verified at onboarding; tracks continuing education hours, E&O insurance and board and MLS dues; can pause listings or deal submission when a licence lapses
Agents	Upload licence details and renewals; get reminders 90, 60 and 30 days before expiry; see continuing education hours done and due

Broker Review & Audit

One queue for everything the broker must review, and evidence ready for regulators.

Who	How it works for them
Brokerage	Reviews documents, ads and transactions in one queue by office; exports audit packs for a state audit or complaint
Agents	See items waiting on them and fix them in place

MLS Display Rules

Each MLS's display rules applied automatically to every page, so brokerages stay compliant without thinking about it.

Who	How it works for them
Brokerage	Relies on per-MLS attribution, disclaimers, logos, sold-data and refresh rules on every page, and on what may be indexed by search engines
Agents	Share any listing knowing the page is compliant
RightAlly HQ	Configures each MLS's rules once for all brokerages in that MLS

Fair Housing Guardrails

Risky wording is caught wherever agents write.

Who	How it works for them
Agents	Get warnings and alternatives on risky wording in listing descriptions, ads, emails and messages as they type
Brokerage	Sees flagged items across the brokerage
Customers	Are treated fairly and consistently in every message and ad

Module recap: Know suite (intelligence and engagement)

Know keeps everyone informed, productive and supported: an AI assistant that sees only the brokerage's own data, live dashboards, training, team communication, help, agent activity tracking, a daily game plan for every agent, DocIQ for documents and mobile access. Nine modules.

Daily Game Plan & AI Coach

Every morning each agent is told exactly what to do, in what order, with every action one click away; the goal is more appointments and closings, not more information.

Who	How it works for them
Agents	Get one daily game plan by email, push or text: the top 5 actions ranked by likely payoff, each with the reason and talking points ("Call Sarah Lee: viewed 14 Oak St three times last night"); tap to call or send a pre-drafted text or email they can edit; see deadlines, documents to sign and deals at risk; see their goal pace from the business planner; get an evening wrap-up of what got done and what moves to tomorrow, plus a weekly coaching note on response time, contact rate and conversion with one specific tip; set quiet hours and channels
Brokerage	Team leads and brokers get their own version ("these 3 agents have hot leads they have not touched"); choose defaults for what the plan includes
RightAlly HQ	The AI learns from anonymised, aggregated outcome patterns (never one brokerage's contacts or deals) which actions lead to appointments and contracts, and ranks better over time

DocIQ

Upload or pick any document, ask questions about it, get it checked and corrected, and let it drive the follow-up automatically; answers come only from the documents provided.

Who	How it works for them
Agents, solo agents and assistants	Upload a contract, addendum, disclosure, inspection report, HOA documents or appraisal, or pick one already in a deal; ask in plain English and get answers that cite the page and section, or "not found in this document"; compare versions ("what changed in this addendum?"); see warnings with suggested corrections (missing signatures or initials, conflicting dates, price or terms that differ from the contract or MLS, calculation errors, missing required addenda), each showing the suggested value and its source; apply fixes in one click on RightAlly smart forms, or get a draft correction addendum for outside documents; turn the document into action automatically: key dates become reminders, parties are identified, documents go out for e-signature, and every party is reminded by email until it is done
Brokerage owners and staff	Use DocIQ on any document they can access; receive "Ask my broker" escalations with the document, question and AI answer together; choose which automations run automatically and which need approval; see every question, warning and correction logged
Customers and other parties	Receive clear email reminders and documents to sign, with fewer errors and delays

Also in DocIQ

Capability	What it does
Auto-sort into the checklist	Drop in a multi-page upload; each document is recognised (contract, disclosure, lead-based paint form, HOA addendum, inspection report) and filed into the right checklist slot

Capability	What it does
Compare versions	A redline between drafts, counteroffers or re-uploaded documents: "What changed between counter 2 and counter 3?"
Scans, photos and handwriting	Reliable reading of phone photos, faxes and handwritten changes
Plain-English and Spanish explanations	"Explain this addendum simply" for clients, shared through the client concierge with a clear "not legal advice" note
Safe sharing	Social Security numbers, bank details and dates of birth blanked out automatically before a document is shared

How DocIQ and Deal-IQ work together. DocIQ is the document brain: it reads each document once. Deal-IQ is the coordinator: it uses what DocIQ read to create and update the deal, timeline, checklist, reminders, compliance scan, repair requests and concierge answers.

Customer has	What works
DocIQ and Deal-IQ	Everything: documents drive the whole deal automatically
DocIQ only	Ask documents, corrections, auto-sort, compare, explain, safe sharing and date reminders; no deal timeline automation, concierge, drafting or party portal
Deal-IQ only	Deal-IQ includes the document reading it needs; asking any document outside deals, explanations and safe sharing need DocIQ

Guardrails. DocIQ answers only from the documents provided and never guesses. It never edits a signed document: corrections go through a new version or addendum that the parties sign. Suggestions are information, not legal advice, and the agent or broker approves before anything is sent. Documents are private to their owner and deal team, encrypted, never used to train AI and kept under the brokerage's retention rules. Everyday use is included within fair-use limits; very large documents or heavy use draw on credits.

RightAlly AI Assistant

An internal chatbot that answers questions and takes actions, guarded to the user's brokerage and permissions.

Who	How it works for them
Agents	Ask "how do I…", "what is my cap status" or "which deals close this week"; have it draft follow-ups, create tasks or check a flyer; every action needs their confirmation
Brokerage	Turns it on per role, adds brokerage FAQs and decides which actions it may take; knows it answers only from the brokerage's data and each user's permissions

Reports & KPIs

Live dashboards, goals and reports from one data model that runs from lead to payout.

Who	How it works for them
Brokerage	Chooses KPIs for the admin dashboard (today's 40 KPI definitions carried over); sets company goals and leaderboards; builds, saves and schedules custom reports with export; gets AI retention alerts when an agent's activity drops, with suggested actions
Agents	See a personal dashboard (GCI, deals, cap, leads, revenue share); use the business planner to turn an income goal into the weekly deals, appointments and calls needed, tracked automatically

Agent Success dashboard. Brokers and agents track the numbers that predict closings: speed to lead (target under one minute), contact rate, appointments per week, conversion at each stage from lead to appointment to contract to closing, and database touches. Pilot brokerages give before-and-after figures, so RightAlly can show proven results rather than promises.

Monthly ROI report. Every month the broker receives an automatic report showing software savings, agent results and adoption, so the value of RightAlly is visible at every renewal.

Agent Activity & Engagement

Brokers see who is active, who has gone quiet and what each agent is doing, so they can coach and keep agents before they leave.

Who	How it works for them
Brokerage	Sees each agent's status (Active, Idle, or Away / out of station after a set number of days without logging in, 4 by default and adjustable), last login and last activity by type (calls, texts, emails, showings, leads accepted, deals created); views an activity feed and engagement score per agent and team; gets inactivity alerts and a weekly digest; runs activity leaderboards; feeds the AI retention alerts
Agents	See their own activity and engagement score, and where they stand on activity leaderboards; what is tracked (work activity only) is set out in the brokerage policy manual

Learn-IQ (Training & Knowledge Base)

Learn-IQ — the agent academy with an AI coach. Most brokerages onboard new agents who know little. RightAlly includes the training: **your new agents learn, close sooner and stay compliant, without hiring a trainer.**

Capability	How it works
AI coach that knows the agent	Personal advice from the agent's state, experience, deals, lead conversion and compliance history (with permission)
Help in the moment	Two-minute guides inside the work the first time it matters, such as a first FHA offer or first probate lead
Debrief after every deal	Three lessons from each closed or failed deal, using Deal-IQ data
Coaching from real calls	With consent, calls scored on questions asked, objections handled and next step set
Voice role-play	AI personas such as the price-focused seller or anxious first-time buyer, scored on the brokerage's scripts
Daily drills	Five-minute practice on the phone, spaced so it sticks
Practice and certification	Sandbox deals (draft an offer, find planted errors), pass to unlock, certificates; certification can lift broker pre-approval on Deal-IQ drafting
Mentor matching	New agents paired with a proven producer
AI course builder	A Zoom recording or policy document becomes a lesson, quiz and role-play in minutes
Proof it works	Time to first deal, production before and after, retention
Goal to daily actions	The income goal is worked back to conversations, appointments and contracts, with today's targets in the daily game plan
Appointment prep and rehearsal	A one-page brief before each listing appointment (CMA, situation, likely objections) and a 3-minute voice rehearsal

Capability	How it works
Live coaching cards on calls	With consent, short prompts only the agent sees during a call, such as "Ask about pre-approval" or "Set the next step"
Voice debrief in the car	30 seconds after a showing or appointment: CRM updated, follow-ups created, one coaching tip
Top-producer playbooks	With their permission, what the brokerage's best agents do differently, turned into playbooks
Skill scorecard	Eight skills scored from real activity, with one weekly focus chosen by the coach
Local market mastery	Weekly 2-minute quizzes from live MLS data
Accountability pods	Groups of 4–6 agents with weekly AI-led check-ins
Closings proof report	Closings by agents who completed the program versus before, per brokerage; also a recruiting message: "Join us and get a personal AI coach"

New Agent Launch Program: a guided first 90 days (onboarding path, daily drills, mentor, weekly AI check-in, first-deal checklist), extra guardrails until certified, and one broker screen with every new agent's progress. Every file is checked before it reaches the broker; the broker remains responsible for supervision.

Broker presence. The AI assistant shows the broker's photo and name, answers agents by text or voice from the brokerage's policies and hands anything else to the real broker; always labelled as AI. With the broker's written consent, milestone messages arrive as short voice messages in the broker's voice, marked as AI, used only for recognition and never for instructions or payments.

Broker Risk Dashboard. Every open risk in one place with a level, owner and due date: compliance blockers, missing disclosures, buyer agreements missing before touring, licence and E&O lapses, advertising violations, unreviewed files, missed deadlines and late MLS status updates.

Courses, onboarding tracks and the policy manual in one place.

Who	How it works for them
Brokerage	Creates courses with videos, documents and quizzes; assigns them by role or as onboarding tracks; publishes and versions the policy manual with acknowledgement; sees completion by agent
Agents	Take courses on web or phone, track progress and certificates, and acknowledge policies

Communication & Chat

Announcements, team chat and events inside the platform.

Who	How it works for them
Brokerage	Posts announcements to the brokerage, an office or a team; creates chat channels; schedules events and meetings with Zoom or Google Meet links
Agents	Chat one-to-one or in groups, share files, react to announcements and RSVP to events

Support & Help Centre

Help articles, tickets and guided tours, so nobody is stuck.

Who	How it works for them
Brokerage	Publishes its own help articles beside RightAlly's; raises tickets to RightAlly; handles agent tickets internally with categories and response targets; turns on guided tours for new features; sees the platform status page
Agents	Search help from any screen, raise tickets to brokerage staff and follow in-app tours
RightAlly HQ	Answers brokerage tickets and publishes release notes and help content

Mobile

Everything on the phone from day one, then native apps.

Who	How it works for them
Agents	Install the mobile web app on their home screen at launch, with push notifications for leads, inbox, deals and earnings; native iOS and Android apps follow version 1.0 on the same APIs
Brokerage	Approves deals, reviews documents and sees dashboards on the phone

How the modules work together

One deal touches more than ten modules without anyone re-typing data; this is the main reason a brokerage replaces its separate tools with RightAlly.

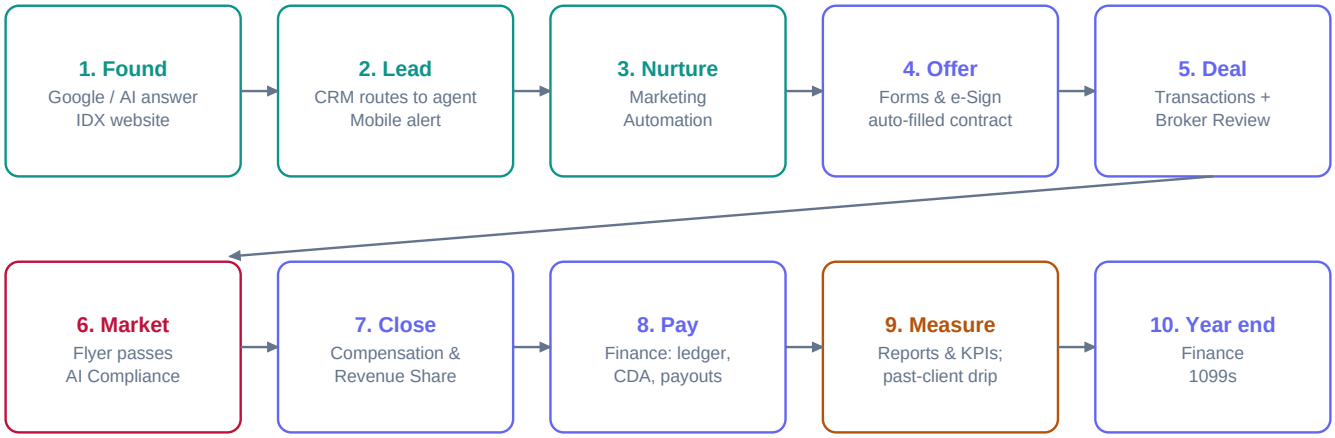

Figure 3 - One deal from first search to year-end 1099

1. A buyer finds the brokerage through a Google search or an AI assistant's answer, searches homes on its **IDX website** and registers after viewing three listings.
2. **CRM & Lead Routing** creates the lead and routes it to the right agent by area; the agent gets a push alert on **Mobile**.
3. **Marketing Automation** starts a buyer drip and listing alerts while the agent follows up.
4. The buyer makes an offer: the agent opens a room in **Forms & e-Sign**, the purchase contract fills itself from CRM and MLS data, and everyone signs online.
5. **Transactions** creates the deal with its checklist and key dates; the broker reviews documents in **Broker Review**.
6. The agent's open-house flyer passes the **AI Ad & Flyer Compliance** check before it is posted.
7. At closing, **Compensation & Revenue Share** calculates the agent split, cap progress, deductions and upline revenue share.
8. **Finance & Payouts** records it in the ledger, generates the CDA, pays the agent and posts revenue share to the upline.
9. **Reports & KPIs** update dashboards and leaderboards; **Marketing Automation** moves the client to a past-client nurture campaign.
10. Year end: **Finance** produces the agent's 1099.

Why brokers choose RightAlly

RightAlly wins by being the easiest and most affordable way to get everything in one place, while matching or beating the leader in each category. Leaders are strong in one or two areas; brokerages still stitch several of them together.

Area	Leaders today	How RightAlly does it better
CRM and lead follow-up	BoldTrail (kvCORE), Lofty, Follow Up Boss	Instant AI response and unified inbox, a simpler interface, and the only CRM tied directly to deals, commissions and revenue share
IDX websites	Luxury Presence, BoldTrail, Lofty, Real Geeks	15 premium templates, plain-English AI search, automatic SEO/AEO audits, very fast pages, MLS compliance built in
Listing marketing and agent pages	Lofty, Luxury Presence, Canva-style tools	Marketing kit generated from MLS data, compliance-checked, with AI video tours and referral links that assign sponsors
Seller leads and CMA	Cloud CMA, RPR	Valuation, CMA, net sheets and seller follow-up connected to the CRM and website
Forms and e-sign	dotloop, Lone Wolf Transact, DocuSign	Forms auto-filled from CRM and MLS, buyer agreement flow, flowing straight into transactions and commissions
Transactions and back office	BoldTrail BackOffice (formerly Brokermint), SkySlope	Deal-IQ AI transaction coordinator, AI document review, native revenue-share and cap engine, double-entry ledger
Compensation and revenue share	Custom systems at large revenue-share brokerages	A plan builder any brokerage can configure, with simulator, genealogy views and transparent statements
Compliance	Few dedicated tools	AI flyer checks with MLS fact checks, sourced compliance answers, licence tracking
Setup and switching	Long setup and steep learning curves	Live the same day, AI setup assistant, one-click and white-glove migration
Prioritisation and closing more	Smart lists and AI lead scoring in BoldTrail and Lofty	A daily game plan with ranked one-click actions, enrichment-based scoring that shows its reasons, database reactivation, and an outcome dashboard that proves results
Lead distribution and referrals	Performance programmes at portals such as Realtor.com; routing rules in CRMs	Portal-style performance distribution inside every brokerage, with scores, tiers, offer windows and automatic reclaim, plus a trust score on every referral partner
Lead generation	Managed ad programmes in BoldTrail, Lofty and lead-gen agencies	Ready buyer and recruiting funnels from the brokerage's own ad accounts, AI-built ads optimised on real closings, quality filters, content and social autopilot, and cost per closing by source
Documents	General AI chat tools and shared AI notebooks	DocIQ answers only from the user's own documents with page citations, suggests corrections, and turns documents into reminders and signature requests automatically
Transaction coordination	ProxiClose, Transaction Wingman, human TCs at $300–500 per deal	Deal-IQ: talk or type to it, contract and addendum drafting, a 24/7 branded client concierge and an all-party portal, inside the same system as forms, e-sign, compliance and commissions
Recruiting and agent engagement	Brokerkit, BoldTrail recruiting tools	Recruiting tied to the brokerage's real comp plans, revenue share and onboarding, plus agent activity tracking and retention alerts in the same platform

Affordable by design. A savings calculator on rightally.io shows each broker what they pay today against RightAlly. Usage-heavy services (SMS, calls, AI, valuations, floor plans) run on prepaid credits at near cost, which keeps the monthly price low. Agents can buy add-ons themselves, so the broker decides what the brokerage pays for and what

agents pay for.

Easy by design. An AI setup assistant turns the broker's own documents into a configured platform; a ready-made library covers common comp plans, workflows and campaigns; one search bar finds anything; simple mode shows agents only today's work; a morning brief tells each person what matters.

Trust by design. Brokerages own their data and can export it at any time, every change is in a tamper-proof audit log, sensitive data is encrypted per brokerage, and AI only ever sees what the person asking is allowed to see.

Built to spread. Agents can start on a solo plan and pull their broker in with "Ask my broker"; brokers get a free health check and a branded preview of their own site; switching carries no risk; and a referral programme plus the recruiting badge mean brokerages without RightAlly feel the pressure to adopt it.

Delivery plan and scope lock

Version 1.0 is planned at about 61 two-week sprints with five teams (the fifth team, for growth and AI engagement, is approved), with existing customers piloting from around Sprint 26 and a committed launch date of Sprint 65 including buffer. The extra sprints carry the CRM database intelligence and the differentiators, all in version 1.0. The scope in this document is locked; anything new goes through a change request that shows its effect on the plan before it is accepted.

Item	Plan
Scope	38 modules in four suites on Platform Core, as recapped in this document
Sprint length	Two weeks; each sprint starts with a detailed specification and merges only with green CI
Team	Four parallel teams, about 18 people: architect and tech lead, Laravel and React engineers, two product designers and a visual designer, QA automation, DevOps, and an AI engineer; a recommended fifth team of about 4 people for the growth modules (lead generation, recruiting, solo plan, referrals)
Pilot	Existing RightAlly customers move across from around Sprint 26 (about 12 months)
Version 1.0	About Sprint 61 (about 28 months) with five teams; committed date Sprint 65 (about 30 months) including a 4-sprint buffer
After version 1.0	Native Flutter apps for iOS and Android on the same APIs

Indicative sequence (the sprint-by-sprint plan follows in the architecture document):

Sprints	Platform and back office	Websites and marketing	CRM, AI and compliance
0	Requirements, architecture, design system	Visual direction, hero templates	Pre-start agreements
1–5	Tenancy, identity, roles and permissions, audit log, branding, domains, packages, billing, RightAlly Credits with rate card, allowances and top-ups	Component library, theming, MLS ingestion, site rendering	Multi-provider AI gateway and model registry
6–9	Workflow engine, agent onboarding with electronic W-9, RightAlly website and signup	Listing search, IDX templates 1–5, SEO and AEO engine	CRM core, instant AI lead response, unified inbox
10–17	Compensation and revenue share with lead-source-based splits, ledger, genealogy views	Website editor, landing builder, templates 6–10, compare homes	Lead sources, routing, power dialer, marketing automation, lead intelligence, lead enrichment, smart scoring and database reactivation, lead distribution and agent performance
18–25	Finance: automatic payouts, money-in tracking, offsets, payables, bank reconciliation, 1099 e-file, finance reports; legacy migration tooling	List-IQ listing studio, video and 360° tours, home valuation and CMA	Showings and client portal, referral network with Referral Trust Score, recruiting suite
26–33	Native forms and e-sign with AI form builder; dotloop, SkySlope, Lone Wolf and DocuSign integrations; transactions, AI document review; pilot go-live around Sprint 26	Templates 11–15, ad campaigns	AI flyer compliance, licence tracking, Deal-IQ

Sprints	Platform and back office	Websites and marketing	CRM, AI and compliance
34–53	Reports and report builder, agent success dashboard, monthly ROI report, agent activity and engagement, training, chat, support centre; RightAlly for Agents solo plan with solo packages, assistant seats and roles, Ask my broker and data portability; referral and affiliate programme; integration marketplace	Lead Generation Engine (buyer funnels, AI ads, conversion feedback, quality filters, content and social autopilot, lead ROI); Recruiting Attraction Engine; solo website templates, savings calculator, Brokerage Health Check and website scan, instant branded preview, agent self-purchase, AI setup assistant, recruiting badge toolkit	Daily game plan and AI coach, DocIQ (document Q&A, corrections and document-driven automation), Compliance Knowledge, RightAlly AI assistant, retention alerts
54–61	Hardening, security and load testing, SOC 2 readiness, migration of all existing customers, launch	Design polish from pilot feedback	AI quality tuning

Start before Sprint 1 (long lead times):

- Meta app review for Marketing API access and a Google Ads API developer token.
- MLS vendor agreements for Mississippi and the second state, and Zillow and Realtor.com lead-integration partner programmes.
- State association form licences, a home valuation and property-data provider (also used for lead enrichment), a floor-plan partner, ShowingTime access where needed, Twilio with A2P 10DLC registration, dotloop, SkySlope, Lone Wolf and DocuSign partner API approvals, AI provider agreements with no-training and zero-data-retention terms, and Stripe Connect platform approval.
- Legal: terms, privacy policy, data processing agreement, AI-feature disclaimers and call-recording consent rules.
- AWS and Cloudflare accounts, SOC 2 readiness tooling, and pricing and packaging decisions (solo agent plan, setup fee, contract terms and referral rewards).

Glossary

Term	Meaning
MLS	Multiple Listing Service: the regional database of homes for sale that brokers share
IDX	Internet Data Exchange: the rules and feed that let a brokerage show MLS listings on its own website
RESO Web API	The industry-standard way MLS data is delivered to software like RightAlly
CMA	Comparative market analysis: a report estimating a home's value from recent nearby sales
GCI	Gross commission income: the total commission a deal earns before splits
Split	How a deal's commission is divided between agent and brokerage
Cap	The maximum an agent pays the brokerage in a period, after which they keep more of each deal
Revenue share	A share of company revenue paid to the agents who recruited (sponsored) the agent who closed the deal, across several levels
Sponsor, upline, downline	The recruiting agent, the chain of sponsors above an agent, and the agents below them
CDA	Commission disbursement authorization: the document telling the title company how to pay commissions at closing
Buyer agreement	The written agreement a buyer signs with their agent before touring homes, required since the 2024 NAR settlement
E&O insurance	Errors and omissions insurance that protects agents and brokerages against claims
Continuing education (CE)	Course hours agents must complete to renew their licence
Fair housing	Federal and state laws banning discrimination in housing, including in advertising
SEO / AEO	Search engine optimisation and answer engine optimisation: being found on Google and cited by AI assistants
CNAME	The DNS setting a brokerage adds so its own domain points to its RightAlly website
Tenant	One brokerage's private space on the shared RightAlly platform
Cell	A self-contained group of servers and databases serving a set of brokerages; RightAlly grows by adding cells
A2P 10DLC	The US registration required for business text messaging
Lead enrichment	Adding verified contact details, property ownership and likely-to-move signals to a contact so agents know who to call first
TIN	Taxpayer identification number, checked on the W-9 so 1099s are filed correctly
Usage credits	Prepaid balance used for SMS, calls, AI and similar services, charged at near cost
